Questions

1. Using Jim

1.1. How can I create a new ImageTag?

Just right-click on the tag into which you want to store your new tag (e.g. right-click on the root tag to add it there) and then select "add image tag".

1.2. How can I move an ImageTag into another tag (make it its child)?

Just change the parent of your ImageTag to the tag where you want to move it.

1.3. Since I updated to Jim 2.1.0 I get problems or lost my configuration!

Have you tried the update.jar? If not see the [update page](#).

2. I use the recommended startup script to start Jim, but nothing happens!

The startup scripts currently only work, if you are in Jim's main directory.
Try to change to the folder where your jimStarter script is stored and start it from there.

3. I really tried your tips but I still have problems!

Well, if you really tried the above tips perhaps I might help. Send me an e-mail to:
