## 1. What is JimFileOrganizer?

### 1.1. Description

JimFileOrganizer is a simple plugin that extends Jim with the functionality to manage the image files on filesystem automatically.

This is done using format-strings to define templates for managing your collection. JimFileOrganizer comes with an additional plugin named JimFileOrganizerGui that provides integration to Jim's standard interface [JimGui](#).

### 1.2. Features

- Flexible and automated sorting of your image files so you will find them even with a file explorer
- Integrates in Jim's standard user interface [JimGui](#)

### 1.3. License

JimFileOrganizer is - like Jim itself - licensed under the [Apache License 2.0](#) and therefore free software.

## 2. Download JimFileOrganizer

### 2.1. Binary downloads

- [JimFileOrganizer, version 2.0.1](#)
- [JimFileOrganizerGui, version 2.0.1](#)
- [older releases](#)

### 2.2. Browse the sources

- [JimFileOrganizer sources, current working copy](#)
- [JimFileOrganizer sources, all versions since 2.0.1](#)
- [JimFileOrganizerGui sources, current working copy](#)
- [JimFileOrganizerGui sources, all versions since 2.0.1](#)

## 3. The developer: David Poetzsch-Heffter

For further information on my person (I'm the one who also wrote Jim itself) see [Jim's](#)
